

Dynamic Triage Assessment

Target: Jane

PIPELINE	Automated Triage Pipeline
CASE ID	VIGIA-REAL-005
PREPARED BY	Autonomous DFIR Agent
REPORT DATE	2026-06-12 UTC

01 Executive Summary

The subject is utilizing multi-layered encryption techniques including AES, BitLocker, and GPG/PGP to obscure sensitive data. This behavior is consistent with deliberate anti-forensic measures. The investigation must move beyond static analysis to include: 1) Recovery of unencrypted artifacts from system caches (specifically for the README file); 2) Execution correlation via Prefetch, Shimcache, and Amcache to identify the binary responsible for encryption; 3) Registry analysis (e.g., MountPoints2) to link the BitLocker volume to user activity; and 4) Systematic recovery attempts for the BitLocker volume 'R2D2' via AD, USB, or backup key locations.

Target Evidence Path	Jane
Analysis Timestamp	2026-06-12 14:16 UTC
Analysis Tooling	Autonomous MCP Framework

03 Extracted Artifacts Matrix

ARTIFACT NAME / IDENTIFIER	FORENSIC ANALYSIS & DESCRIPTION
README file	AES-encrypted file. Forensic priority: Search unallocated space and system caches for unencrypted versions.
GPG/PGP keys	Asymmetric encrypted communication keys. Forensic priority: Correlate creation with execution artifacts (Prefetch/Shimcache/Amcache) to identify the responsible process.
BitLocker volume	Full disk encryption. Forensic priority: Locate recovery keys (AD, USB, or backup files) and analyze Registry (MountPoints2) to link volume to user activity.

This report was produced automatically via an LLM-driven forensic pipeline. Findings are based strictly on evidence present in the provided target at the time of analysis.
